 s July 11, 2022

# Hyperplanes

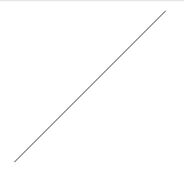

### Definition 1.1

A hyperplane in an *n*-dimensional space is a n-1 dimensional plane.

# Hyperplanes

### Definition 1.1

A hyperplane in an *n*-dimensional space is a n-1 dimensional plane.

# Hyperplane Arrangements

Definition 1.2

A hyperplane arrangement is simply a collection of hyperplanes.

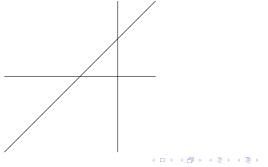

$$\mathcal{A} = \{H_0, H_1, \cdots H_m\}$$

### Hyperplane Arrangements

Definition 1.2

A hyperplane arrangement is simply a collection of hyperplanes.

$$\mathcal{A} = \{H_0, H_1, \cdots H_m\}$$

Vincent Cheng

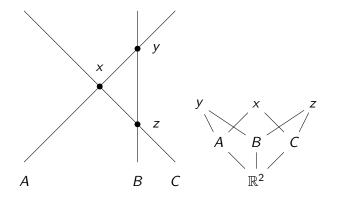

Introduction to Hyperplane Arrangements

July 11, 2022

• Each hyperplane arrangement has a corresponding intersection poset denoted *L*(*A*).

- Each hyperplane arrangement has a corresponding intersection poset denoted L(A).
- The elements of the poset are the entire space, the hyperplanes, and the various non-empty intersections of the hyperplanes

- Each hyperplane arrangement has a corresponding intersection poset denoted L(A).
- The elements of the poset are the entire space, the hyperplanes, and the various non-empty intersections of the hyperplanes
- The poset is ordered by reverse-inclusion meaning  $x \le y$  if  $x \supseteq y$

## The Mobius function

The Mobius function  $\mu$  is defined recursively on the elements of L(A)

$$\sum_{x \le z} \mu(x) = 0$$

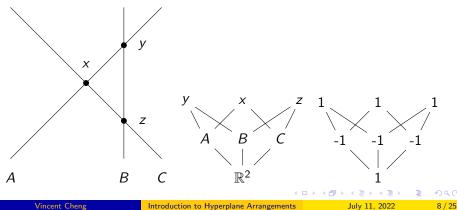

for all elements  $z \in L(\mathcal{A})$  and  $\mu(\mathbb{R}^n) = 1$ .

## The Mobius function

The Mobius function  $\mu$  is defined recursively on the elements of L(A)

$$\sum_{x\leq z}\mu(x)=0$$

for all elements  $z \in L(\mathcal{A})$  and  $\mu(\mathbb{R}^n) = 1$ .

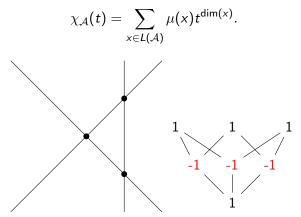

# Characteristic Polynomial

The characteristic polynomial of an arrangement  ${\cal A}$  is defined as

$$\chi_{\mathcal{A}}(t) = \sum_{x \in L(\mathcal{A})} \mu(x) t^{\dim(x)}.$$

# Characteristic Polynomial

The characteristic polynomial of an arrangement  ${\cal A}$  is defined as

 $t^2 - 3t + 3$ 

イロト イポト イヨト イヨト

9/25

## General position

We will mostly be dealing with arrangements in general position.

Definition 1.3

 ${\mathcal A}$  is in general position if

$$\{H_1, \ldots, H_p\} \subseteq \mathcal{A}, p \leq n \Rightarrow \dim(H_1 \cap \ldots H_p) = n - p$$
$$\{H_1, \ldots, H_p\} \subseteq \mathcal{A}, p > n \Rightarrow H_1 \cap \ldots H_p = \emptyset.$$

You should be able to slightly move around the hyperplanes and have the same number of regions.

### Definitions

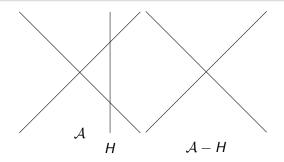

### Definition 2.1 (Deletion)

 $\mathcal{A} - H$  represents the arrangement  $\mathcal{A}$  with hyperplane H removed.

# Definitions

### Definition 2.1 (Deletion)

 $\mathcal{A} - H$  represents the arrangement  $\mathcal{A}$  with hyperplane H removed.

### Restriction

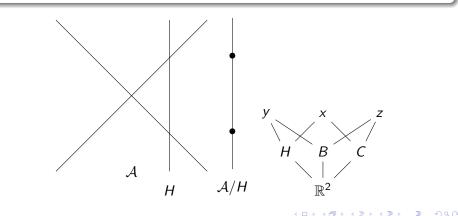

### Definition 2.2 (Restriction)

 $\mathcal{A}/H$  represents the new arrangement with only elements greater than or equal to H in the  $L(\mathcal{A})$ .

### Restriction

### Definition 2.2 (Restriction)

 $\mathcal{A}/H$  represents the new arrangement with only elements greater than or equal to H in the  $L(\mathcal{A})$ .

#### Theorem 2.3

Given an arrangement A and a hyperplane H in A,

$$r(\mathcal{A}) = r(\mathcal{A} - H) + r(\mathcal{A}/H).$$

イロト イポト イヨト イヨト

#### Theorem 2.3

Given an arrangement  $\mathcal{A}$  and a hyperplane H in  $\mathcal{A}$ ,

$$r(\mathcal{A}) = r(\mathcal{A} - H) + r(\mathcal{A}/H).$$

• Consider the regions that are unaffected by  ${\boldsymbol{H}}$ 

< □ > < □ > < □ > < □ > < □ > < □ >

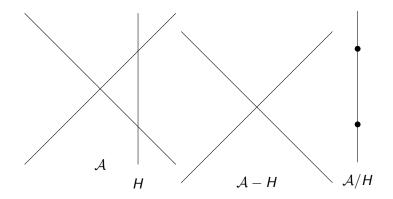

#### Theorem 2.3

Given an arrangement  $\mathcal{A}$  and a hyperplane H in  $\mathcal{A}$ ,

$$r(\mathcal{A}) = r(\mathcal{A} - H) + r(\mathcal{A}/H).$$

- Consider the regions that are unaffected by H
- Consider the regions that are cut by H

∃ ► < ∃ ►</p>

# Characteristic polynomials

#### Theorem 2.4

Given an arrangement A and a hyperplane H in A,

$$\chi_{\mathcal{A}}(t) = \chi_{\mathcal{A}-\mathcal{H}}(t) - \chi_{\mathcal{A}/\mathcal{H}}(t).$$

< □ > < 同 > < 回 > < 回 > < 回 >

# Characteristic polynomials

#### Theorem 2.4

Given an arrangement A and a hyperplane H in A,

$$\chi_{\mathcal{A}}(t) = \chi_{\mathcal{A}-\mathcal{H}}(t) - \chi_{\mathcal{A}/\mathcal{H}}(t).$$

• Proof uses Whitney's theorem

< □ > < □ > < □ > < □ > < □ > < □ >

### Zaslavsky's Theorem

#### Theorem 2.5

# $r(\mathcal{A}) = (-1)^n \chi_{\mathcal{A}}(-1)$

# Zaslavsky's Theorem

#### Theorem 2.5

$$r(\mathcal{A}) = (-1)^n \chi_{\mathcal{A}}(-1)$$

Proof uses the fact that both sides can be broken down into A - H and A/H terms. Induction can then be used.

# Zaslavsky's Theorem

▲ □ ▶ ▲ @ ▶ ▲ @ ▶ ▲ @ ▶
 s July 11, 2022

#### Theorem 3.1

For a sufficiently large prime q where  $L(\mathcal{A}) \cong L(\mathcal{A}_q)$ ,

$$\chi_{\mathcal{A}}(q) = \#(\mathbb{F}_q^n - \bigcup_{H \in A_q} H)$$

æ

#### Theorem 3.1

For a sufficiently large prime q where  $L(\mathcal{A}) \cong L(\mathcal{A}_q)$ ,

$$\chi_{\mathcal{A}}(q) = \#(\mathbb{F}_q^n - \bigcup_{H \in A_q} H)$$

### **Examples**

We will be able to use the finite field method to easily calculate the number of regions for Coxeter arrangements.

$$\mathcal{A}_n = \{x_i - x_j = 0 : 1 \le i < j \le n\}$$
$$\mathcal{C}_n = \{x_i - x_j = -1, 0, 1 : 1 \le i < j \le n\}$$
$$\mathcal{D}_n = \mathcal{A}_n \cup \{x_i + x_j = 0 : 1 \le i < j \le n\}$$
$$\mathcal{B}_n = \mathcal{D}_n \cup \{x_i = 0 : 1 \le i \le n\}$$

How many ways are there to pick a coordinate (x<sub>1</sub>, x<sub>2</sub>, ··· x<sub>n</sub>) such that x<sub>i</sub> ≠ x<sub>j</sub>.

- How many ways are there to pick a coordinate (x<sub>1</sub>, x<sub>2</sub>, · · · x<sub>n</sub>) such that x<sub>i</sub> ≠ x<sub>j</sub>.
- q ways to pick the first, q-1 ways to pick the second, ...
